

How do I use Remote Play?

Information from Steam Documentation:

https://support.steampowered.com/kb_article.php?ref=3629-riav-1617

Log in to the Steam client on the computer with the installed game you wish to play.

Now, Log into Steam on another computer or a supported device with Steam Link app installed.

From there, you can launch and play the game remotely from the Steam Library.

Remote Play Together

1. Launch your game.
2. Make sure your friend is logged in to Steam from a supported device.
3. Open your Steam Overlay in-game (shift+tab).
4. From your friends list, select 'Remote Play Together'.
5. Once your friend accepts the invite, they will be in-game with you.

How do I improve my streaming experience?

Hardware:

We recommend a minimum of a quad-core CPU for the computer running the game. The client has more modest requirements, but should have a GPU that supports hardware accelerated H264 decoding. Any recent laptop or PC should meet the client requirements.

Network:

We recommend using a wired network for the best streaming experience. People have had some success with powerline networks and wireless N and AC networks with good signal, though your experience may vary.

Game Settings:

To improve your streaming experience, you can go into your game settings and lower your resolution and turn off vertical sync.

Steam Settings:

In the Remote Play settings you can change a number of things that can affect your experience. You can change your preference for speed vs quality, limit the network bandwidth, and adjust the maximum capture resolution.
